

## LAB WORK - 3

Aawishkar Tiwari

Computer Engineering – 3<sup>rd</sup> Semester

Roll no – 59

GitHub: [https://github.com/SamirWagle/CE2020\\_Lab5\\_59\\_60](https://github.com/SamirWagle/CE2020_Lab5_59_60)

Output Screen:

```
How many times do you want to sort: 3
How many numbers do you want to sort:12345
Generating random values...
Random values generated and stored successfully
*****
TOTAL TIME (MILLISECOND) REQUIRED TO SORT THE DATA USING QUICKSORT:2
*****
How many numbers do you want to sort:23456
Generating random values...
Random values generated and stored successfully
*****
TOTAL TIME (MILLISECOND) REQUIRED TO SORT THE DATA USING QUICKSORT:12
*****
How many numbers do you want to sort:34567
Generating random values...
Random values generated and stored successfully
*****
TOTAL TIME (MILLISECOND) REQUIRED TO SORT THE DATA USING QUICKSORT:28
*****

```

Sort.cpp

For Quicksort:

```
#include <vector>

int partition(std::vector<int> & vect, int small, int large)
{
    int pivot = vect[large];
    int i = small-1;
    for(int j=small;j<large;j++){
        if(vect[j]<=pivot){
            i=i+1;
            int temp1=vect[i];
            vect[i]=vect[j];
            vect[j]=temp1;
        }
    }
    int temp2=vect[i+1];
    vect[i+1]=vect[large];
    vect[large]=temp2;
    return i+1;
}
```

```

        vect[j]=temp1;
    }
}

int temp2 = vect[i+1];
vect[i+1] = vect[large];
vect[large] = temp2;
return i+1;
}

void QuickSort(std::vector<int> & vect, int low, int high)
{
    int pivot;

    if (low < high)
    {
        pivot = partition(vect, low, high);
        QuickSort(vect, low, pivot - 1);
        QuickSort(vect, pivot + 1, high);
    }
}

```

Main.cpp

For QuickSort

```

#include <iostream>
#include <vector>
#include <ctime>
#include <random>
#include <chrono>
#include "sort.cpp"

using namespace std::chrono;
using namespace std;

int main()
{
    int size = 0, times;
    string choice;
    bool repeat = true;

    cout << "\nHow many times do you want to sort: ";
    cin >> times;
}

```

```

srand(time(nullptr));

for (int i = 1; i <= times; i++)
{
    std::vector<int> vector1;
    std::vector<int> vector2;

    cout << "\nHow many numbers do you want to sort:";
    cin >> size;

    cout << "\nGenerating random values..." << endl;
    for (int j = 0; j < size; j++)
    {
        int value = rand() % 500;
        vector1.push_back(value);
        vector2.push_back(value);
    }
    cout << "\nRandom values generated and stored successfully" << endl;

    auto startquick = high_resolution_clock::now();
    QuickSort(vector1, 0, size);
    auto stopquick = high_resolution_clock::now();
    auto durationquick = duration_cast<milliseconds>(stopquick - startquick);

    cout << "\n*****" << endl;

    cout << "\nTOTAL TIME (MILLISECOND) REQUIRED TO SORT THE DATA USING
QUICKSORT:" << durationquick.count() << endl;

    cout << "\n*****" << endl;
}
}

```
